

Example

No.	x_1	x_2	x_3	x_4	x_5	x_6	y
1	0	0	0	2	3	1	1
2	2	1	1	1	0	0	0
3	2	1	1	1	3	0	1
4	1	0	0	0	0	1	0
5	2	2	1	2	2	1	1
6	1	2	1	0	2	1	0
7	1	1	0	2	2	1	1
8	0	1	0	1	2	0	0
9	0	0	1	0	0	0	1
10	2	0	1	0	0	0	0
11	1	1	0	2	1	1	?

$$X = (x_1, x_2, x_3, x_4, x_5, x_6)$$

$$\text{Instance space} = |\{X\}| = 432$$

Concept learning/regression: $f?$, $y = f(X)$

$$\text{Prediction: } f(1, 1, 0, 2, 1, 1) = ?$$

$$\text{Error}(f) = \frac{|\{X|f(X) \neq y\}|}{432}$$

Concept learning

Propositinal Rules

$$x_1 = 0 \wedge x_2 = 0 \rightarrow y = 1$$

$$x_1 = 1 \wedge x_2 = 1 \rightarrow y = 1$$

$$x_1 = 2 \wedge x_2 = 2 \rightarrow y = 1$$

$$x_5 = 3 \rightarrow y = 1$$

$$x_1 = 0 \wedge x_2 = 1 \wedge x_5 = 0 \rightarrow y = 0$$

$$x_1 = 0 \wedge x_2 = 2 \wedge x_5 = 0 \rightarrow y = 0$$

$$x_1 = 0 \wedge x_2 = 1 \wedge x_5 = 1 \rightarrow y = 0$$

$$x_1 = 0 \wedge x_2 = 2 \wedge x_5 = 1 \rightarrow y = 0$$

...

Decision table

if $x_1 = 0 \wedge x_2 = 0$ then $y = 1$

else if $x_1 = 1 \wedge x_2 = 1$ then $y = 1$

else if $x_1 = 2 \wedge x_2 = 2$ then $y = 1$

else if $x_5 = 3$ then $y = 1$

else $y = 0$

Relational representation

(variables, relations: =, \neq)

$$x_1 = x_2 \vee x_5 = 3 \rightarrow y = 1$$

$$x_1 \neq x_2 \wedge x_5 \neq 3 \rightarrow y = 0$$

Lazy learning

K-Nearest Neighbour (k-NN)

$$D(X, Y) = \sum_{i=1}^6 d(X_i, Y_i), \quad d(x, y) = \begin{cases} 0, & x = y \\ 1, & x \neq y \end{cases}$$

Y	1	2	3	4	5	6	7	8	9	10
$D(X, Y)$	3	5	5	3	4	4	1	4	6	6
y	1	0	1	0	1	0	1	0	1	0

$D(X, Y)$	1	3	3	4	4	4	5	5	6	6
y	1	1	0	1	0	0	0	1	1	0

K	1	2	3	4	5	6	7
1/0	1/0	2/0	2/1	3/1	3/2	3/3	3/4
$y(X)$	1	1	1	1	1	?	0

Similarity of first order terms

$size(A) = \# \text{ symbols} - \# \text{ different variables}$

Example: $size(p(X, Y)) = 1$, $size(p(X, X)) = 2$

$A \geq B \Leftrightarrow size(A) \leq size(B)$

$D(A, B) = size(A) + size(B) - 2 * size(lgg(A, B))$

Example:

$D(p(a, a), p(b, b)) = size(p(a, a)) + size(p(b, b)) - 2 * size(p(X, X)) = 3 + 3 - 2 * 2 = 2$

Simple Bayes

Probabilistic Networks

Each node contains a probability table

- Node Y : $P(Y = y)$
- Node x_i : $P(x_i = v|Y = y)$

Given a new example X , we compute $P(Y = y|X)$ and choose the class y with the highest probability.

$$P(Y = y|X) = \frac{P(X|Y=y)P(Y=y)}{P(X)}$$

$$P(X|Y = y) = P(x_1 = v_1|Y = y) \dots P(x_n = v_n|Y = y)$$

Computing the probabilities

- $P(x_i = v_j|Y = y)$ is the fraction of training examples in class y where $x_i = v_j$
- $P(Y = y)$ is the fraction of training examples belonging to class y

Clustering

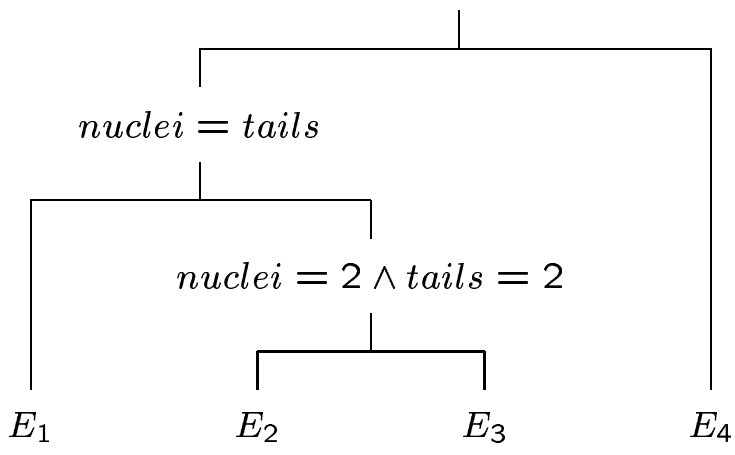

<i>color = light</i>	<i>color = light</i>	<i>color = dark</i>	<i>color = dark</i>
<i>nuclei = 1</i>	<i>nuclei = 2</i>	<i>nuclei = 2</i>	<i>nuclei = 3</i>
<i>tails = 1</i>	<i>tails = 2</i>	<i>tails = 2</i>	<i>tails = 1</i>

Conceptual:

Induction Task

$(L, L_B \subseteq L, L_E \subseteq L, L_H \subseteq L, \rightarrow)$

Given background knowledge $B \in L_B$, positive examples $E^+ \in L_E$ and negative examples $E^- \in L_E$, find a hypothesis $H \in L_H$, such that:

1. $B \not\vdash E^+$ (necessity);
2. $B \not\vdash E^-$ (weak consistency);
3. $B \cup H \rightarrow E^+$ (sufficiency);
4. $B \cup H \not\vdash E^-$ (strong consistency).

Hypothesis generality/specificity:

$H \geq H' \Leftrightarrow \{e | e \in L_E, H \rightarrow e\} \supseteq \{e | e \in L_E, H' \rightarrow e\}$.

Most general hypothesis \top : $e \in L_E \Rightarrow \top \rightarrow e$.

Most specific hypothesis \perp : $e \in E^+ \Leftrightarrow \perp \rightarrow e$.

Hypothesis space: $\{H | H \geq \perp, H \leq \top\}$

Generalization (specialization) operators:

$H' = \rho(H)$, $H' \geq H$ ($H' \leq H$)

Examples: grouping condition ($H_1 \geq H_2 \Leftrightarrow H_1 \subseteq H_2$),
term instantiation ($t_1 \geq t_2 \Leftrightarrow \exists \theta, t_1\theta = t_2$).

Least general generalization (lgg): $H = \text{lgg}(H_1, H_2)$ iff
 $H \geq H_1$, $H \geq H_2$ and $\forall H', H' \geq H_1, H' \geq H_2 \Rightarrow H' \geq H$.

Examples: $\text{lgg}(H_1, H_2) = H_1 \cap H_2$, most specific antiunifier
($\text{lgg}(p(a, a), p(b, b)) = p(X, X)$).

Lgg-based bottom-up search

Propositional language:

$E = \cup_{i=1}^k E_i$, $B = \emptyset$, $H = \{H_1, H_2, \dots, H_k\}$, H_i satisfies the induction task for $E^+ = E_i$, $E^- = E \setminus E_i$, $B = \emptyset$.

1. choose $e_i, e_j \in E_k$ for some k ;
2. $H_{ij}^k = lgg(e_i, e_j)$;
3. if $h_{ij}^k \not\rightarrow e, e \in E^l, l \neq k$ then
 $E^k = (E^k \setminus \{e | h_{ij}^k \rightarrow e\}) \cup \{h_{ij}^k\}$;
4. if step 1 or 3 are impossible then stop else go to 1.

Relational language:

θ -Subsumption: $C_1 \geq_{\theta} C_2 \Leftrightarrow \exists \theta C_1 \theta \subseteq C_2$.

$lgg_{\theta}(C_1, C_2) = \{L | L = lgg(L_1, L_2), L_i \in C_i, i = 1, 2\}$

Relative lgg:

$C = rlgg(C_1, C_2, B) \Leftrightarrow B \cup C \models C_1, B \cup C \models C_2$

$E = E^+ \cup E^-$, B – ground atoms, H – Horn clauses.

$rlgg(e_1, e_2, B) = lgg_{\theta}((e_1 : -B), (e_2 : -B))$

1. choose $e_i, e_j \in E^+$;
2. $C_{ij} = rlgg(e_i, e_j, B)$;
3. Reduce C_{ij}
4. $E^+ = E^+ \setminus \{e | B \cup C_{ij} \models e\}$;
5. if $E^+ = \emptyset$ then stop else go to 1.

Top-down relational learning

$$E^+ = \{ \text{member}(a,[a,b]), \text{member}(b,[b]), \text{member}(b,[a,b]) \},$$

$$E^- = \{ \text{member}(x,[a,b]) \}$$

Specialization operator (θ -subsumption):

- $\rho(C) = C\theta, |\theta| = 1$
- $\rho(C) = C \cup \neg L$

Leaves:

- successful: $C \models e \Rightarrow e \in E^+$
- unsuccessul: $\nexists e \in E^+, C \models e.$

Divide-and-conquer strategy – decision trees

- $x_3 = 1 \wedge x_1 = 0 \rightarrow y = 1$
- $x_3 = 1 \wedge x_1 = 1 \rightarrow y = 0$
- $x_3 = 1 \wedge x_1 = 2 \wedge x_5 = 2 \rightarrow y = 1$
- $x_3 = 1 \wedge x_1 = 2 \wedge x_5 = 3 \rightarrow y = 1$
- $x_3 = 1 \wedge x_1 = 2 \wedge x_5 = 0 \rightarrow y = 0$
- $x_3 = 0 \wedge x_5 = 0 \rightarrow y = 0$
- $x_3 = 0 \wedge x_5 = 3 \rightarrow y = 1$
- $x_3 = 0 \wedge x_5 = 2 \wedge x_6 = 0 \rightarrow y = 0$
- $x_3 = 0 \wedge x_5 = 2 \wedge x_6 = 1 \rightarrow y = 1$

TDIDT algorithm:

1. If all examples in E are of a single class then generate a leaf node labeled with this class. Otherwise *choose* an attribute A with values v_1, v_2, \dots, v_n and build a decision node as follows:

2. $E = \cup_{i=1}^n E_i$, where $E_i = \{e | e \in E, A = v_i \in e\}$
3. Call the algorithm recursively for each E_i , $i = 1, \dots, n$.
